

DishaSetu AI

Implementation / Feasibility Plan

How DishaSetu AI Can Be Implemented

DishaSetu AI is implementable using a modular web-platform architecture where candidate, organization and administrative workflows are connected through a common backend and database.

1. Candidate Module

- Profile and career information
- Skill assessment
- Skill gap analysis
- Career roadmap
- Learning and preparation

2. Organization Module

- Organization profile
- Opportunity creation
- Required skill definition
- Candidate applications
- AI-assisted candidate evaluation

3. Admin Module

- User and organization management
- Opportunity/platform management
- Overall ecosystem monitoring

Technology Stack & Technical Feasibility

AREA	TECHNOLOGY / APPROACH
FRONTEND	React, JavaScript/JSX, Vite, Tailwind CSS
BACKEND	Node.js, Express.js
DATABASE	MongoDB, Mongoose
AI LAYER	Gemini API + application-specific AI services
BUSINESS LOGIC	Deterministic backend validation and matching logic
AUTHENTICATION	Existing application authentication system
DEPLOYMENT	Web-based deployment architecture

Why Implementation Is Feasible

- Modular architecture allows candidate, organization and admin features to be developed independently.
- Existing web technologies support the required frontend, backend and database workflows.
- AI capabilities can be integrated through APIs while deterministic backend logic handles validation and business rules.
- The platform can be developed and deployed incrementally, module by module.
- The architecture supports integration of additional opportunities, organizations and users as the platform grows.

Implementation Roadmap

1

CORE PLATFORM

Authentication → Profiles → Database → Role-based workflows

2

CAREER READINESS

Assessment → Skill Gap → Roadmap → Learning

3

AI INTELLIGENCE

Resume Analysis → AI Guidance → Mock Interview

4

RECRUITMENT

Opportunity Creation → Skill Matching → Applications → Evaluation → Interview
→ Hire

5

DEPLOYMENT & VALIDATION

Testing → Integration → Deployment → User Feedback → Iterative Improvement

Feasibility Considerations

- **Technical Feasibility** — The required workflows can be implemented using the existing web and AI architecture.
- **Operational Feasibility** — Candidates and organizations use separate role-based workflows within the same platform.
- **Integration Feasibility** — AI services and deterministic backend logic can work together through defined application APIs.
- **Deployment Feasibility** — The solution can be deployed as a web-based platform with separate frontend, backend and database services.

“DishaSetu AI is technically and operationally feasible because its core workflows can be implemented incrementally using modular web architecture, existing AI capabilities and deterministic backend logic.”
